#### Abstract

Some sharp discrete inequalities in normed linear spaces are obtained. New reverses of the generalised triangle inequality are also given.

## 1. Introduction

Let $(X,\|\cdot\|)$ be a normed linear space over the real or complex number field $\mathbb{K}$. The mapping $f: X \rightarrow \mathbb{R}, f(x)=\frac{1}{2}\|x\|^{2}$ is obviously convex on $X$ and then there exists the following limits:

$$
\begin{aligned}
\langle x, y\rangle_{i} & :=\lim _{t \rightarrow 0-} \frac{\|y+t x\|^{2}-\|y\|^{2}}{2 t} \\
\langle x, y\rangle_{s} & :=\lim _{\tau \rightarrow 0+} \frac{\|y+\tau x\|^{2}-\|y\|^{2}}{2 \tau}
\end{aligned}
$$

for any two vectors in $X$. The mapping $\langle\cdot, \cdot\rangle_{s}\left(\langle\cdot, \cdot\rangle_{i}\right)$ will be called the superior semi-inner product (inferior semi-inner product) associated to the norm $\|\cdot\|$.

[^0]The following fundamental calculus rules are valid for these semi-inner products (see for instance [4, p. 27-32]):

$$
\begin{align*}
\langle x, x\rangle_{p} & =\|x\|^{2} \quad \text { for } x \in X ;  \tag{1.1}\\
\langle\lambda x, y\rangle_{p} & =\lambda\langle x, y\rangle_{p} \quad \text { for } \lambda \geq 0 \text { and } x, y \in X ;  \tag{1.2}\\
\langle x, \lambda y\rangle_{p} & =\lambda\langle x, y\rangle_{p} \quad \text { for } \lambda \geq 0 \text { and } x, y \in X ;  \tag{1.3}\\
\langle\lambda x, y\rangle_{p} & =\lambda\langle x, y\rangle_{q} \quad \text { for } \lambda \leq 0 \text { and } x, y \in X ;  \tag{1.4}\\
\langle\alpha x, \beta y\rangle_{p} & =\alpha \beta\langle x, y\rangle_{p} \quad \text { for } \alpha, \beta \in \mathbb{R} \text { with } \alpha \beta \geq 0 \text { and } x, y \in X ;  \tag{1.5}\\
\langle-x, y\rangle_{p} & =\langle x,-y\rangle_{p}=-\langle x, y\rangle_{q} \quad \text { for } x, y \in X ; \tag{1.6}
\end{align*}
$$

where $p, q \in\{s, i\}$ and $p \neq q$.
The following inequality is valid:

$$
\begin{align*}
\frac{\|y+t x\|^{2}-\|y\|^{2}}{2 t} & \geq\langle x, y\rangle_{s} \geq\langle x, y\rangle_{i}  \tag{1.7}\\
& \geq \frac{\|y+s x\|^{2}-\|y\|^{2}}{2 s}
\end{align*}
$$

for any $x, y \in X$ and $s<0<t$.
An important result is the following Schwarz inequality:

$$
\begin{equation*}
\left|\langle x, y\rangle_{p}\right| \leq\|x\|\|y\| \quad \text { for each } x, y \in X . \tag{1.8}
\end{equation*}
$$

Also, the following properties of sub(super)-additivity should be noted:

$$
\begin{equation*}
\left\langle x_{1}+x_{2}, y\right\rangle_{s(i)} \leq(\geq)\left\langle x_{1}, y\right\rangle_{s(i)}+\left\langle x_{2}, y\right\rangle_{s(i)} \tag{1.9}
\end{equation*}
$$

for each $x_{1}, x_{2}, y \in X$.
Another important property of "quasi-linearity" holds as well:

$$
\begin{equation*}
\langle\alpha x+y, x\rangle_{p}=\alpha\|x\|^{2}+\langle y, x\rangle_{p} \tag{1.10}
\end{equation*}
$$

for any $x, y \in X$ and $\alpha$ a real number, where $p=s$ or $p=i$.
Finally, we mention the continuity property:

$$
\begin{equation*}
\left|\langle y+z, x\rangle_{p}-\langle z, x\rangle_{p}\right| \leq\|y\|\|x\| \tag{1.11}
\end{equation*}
$$

for each $x, y, z \in X$ and $p=s$ or $p=i$.
One of the most used inequalities in normed spaces is the triangle inequality for several vectors, i.e.,

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} x_{j}\right\| \leq \sum_{j=1}^{n}\left\|x_{j}\right\| \tag{1.12}
\end{equation*}
$$

for any $x_{j} \in X, j \in\{1, \ldots, n\}$.

The main aim of this paper is to point out some inequalities for norms of the vectors $x_{j}$ and $\sum_{j=1}^{n} x_{j}$, including some reverses of the triangle inequality in the multiplicative form, i.e., lower bounds for the quantity

$$
\frac{\left\|\sum_{j=1}^{n} x_{j}\right\|}{\sum_{j=1}^{n}\left\|x_{j}\right\|},
$$

provided that not all $x_{j}$ are zero and satisfy some appropriate conditions.
For classical results related to the reverse of the triangle inequality in normed spaces see [3], [7], [9] and [8]. For more recent results, see [5], [6], [1] and [2].

## 2. The results

The following lemma is of interest itself as well.
Lemma 2.1. Let $(X,\|\cdot\|)$ be a normed linear space. If $x, a \in X$, then

$$
\begin{equation*}
\langle x, a\rangle_{i} \geq \frac{1}{2}\left(\|a\|^{2}-\|x-a\|^{2}\right) . \tag{2.1}
\end{equation*}
$$

If $\|a\|>\|x-a\|$, then the constant $\frac{1}{2}$ cannot be replaced by a larger quantity. Proof. Utilising the semi-inner product properties, we have by (1.7) that

$$
\langle x, a\rangle_{i}=\lim _{s \rightarrow 0-} \frac{\|a+s x\|^{2}-\|a\|^{2}}{2 s} \geq \frac{\|a+(-1) x\|^{2}-\|a\|^{2}}{2(-1)}=\frac{\|a\|^{2}-\|x-a\|^{2}}{2}
$$

and the inequality (2.1) is proved.
Now, assume that $\|a\|>\|x-a\|$ and there exists a $C>0$ with the property that

$$
\begin{equation*}
\langle x, a\rangle_{i} \geq C\left(\|a\|^{2}-\|x-a\|^{2}\right) . \tag{2.2}
\end{equation*}
$$

Obviously $a \neq 0$, and if we choose $x=\varepsilon a, \varepsilon \in(0,1)$, then $\|a\|>\|x-a\|$ since $\|x-a\|=(1-\varepsilon)\|a\|$. Replacing $x$ by $\varepsilon a$ in (2.2) we get

$$
\varepsilon\|a\|^{2} \geq C\left(\|a\|^{2}-(1-\varepsilon)^{2}\|a\|^{2}\right)
$$

giving

$$
\varepsilon \geq C\left(2 \varepsilon-\varepsilon^{2}\right)
$$

for any $\varepsilon \in(0,1)$. This is in fact $1 \geq C(2-\varepsilon)$ and if we let $\varepsilon \rightarrow 0+$, we get $C \leq \frac{1}{2}$.

Remark 2.2. As a coarser, but maybe more useful inequality, we can state that

$$
\begin{equation*}
\langle x, a\rangle_{i} \geq \frac{1}{2}\|x\|(\|a\|-\|x-a\|), \tag{2.3}
\end{equation*}
$$

provided $\|a\| \geq\|x-a\|$.
We observe that (2.3) follows from (2.1) since, for $\|a\| \geq\|x-a\|$, the triangle inequality gives:

$$
\begin{aligned}
\frac{1}{2}\left(\|a\|^{2}-\|x-a\|^{2}\right) & =\frac{1}{2}(\|a\|-\|x-a\|)(\|a\|+\|x-a\|) \\
& \geq \frac{1}{2}(\|a\|-\|x-a\|)\|x\|
\end{aligned}
$$

It is an open question whether the constant $\frac{1}{2}$ in (2.3) is sharp.
The following result may be stated.
Theorem 2.3. Let $(X,\|\cdot\|)$ be a normed space and $x_{j} \in X, j \in\{1, \ldots, n\}$, $a \in X \backslash\{0\}$. Then for any $p_{j} \geq 0, j \in\{1, \ldots, n\}$ with $\sum_{j=1}^{n} p_{j}=1$ we have

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|\|a\|+\frac{1}{2} \sum_{j=1}^{n} p_{j}\left\|x_{j}-a\right\|^{2} \geq \frac{1}{2}\|a\|^{2} . \tag{2.4}
\end{equation*}
$$

The constant $\frac{1}{2}$ in the right hand side of (2.4) is best possible in the sense that it cannot be replaced by a larger quantity.

Proof. We apply Lemma 2.1 on stating that

$$
\left\langle x_{j}, a\right\rangle_{i}+\frac{1}{2}\left\|x_{j}-a\right\|^{2} \geq \frac{1}{2}\|a\|^{2}
$$

for each $j \in\{1, \ldots, n\}$.
Multiplying with $p_{j} \geq 0$ and summing over $j$ from 1 to $n$, we get

$$
\begin{equation*}
\sum_{j=1}^{n} p_{j}\left\langle x_{j}, a\right\rangle_{i}+\frac{1}{2} \sum_{j=1}^{n} p_{j}\left\|x_{j}-a\right\|^{2} \geq \frac{1}{2}\|a\|^{2} \sum_{j=1}^{n} p_{j} . \tag{2.5}
\end{equation*}
$$

Utilising the superadditivity property of the semi-inner product $\langle\cdot, \cdot\rangle_{i}$ in the first variable (see [4, p. 29]) we have

$$
\begin{equation*}
\left\langle\sum_{j=1}^{n} p_{j} x_{j}, a\right\rangle_{i} \geq \sum_{j=1}^{n} p_{j}\left\langle x_{j}, a\right\rangle_{i} . \tag{2.6}
\end{equation*}
$$

By the Schwarz inequality applied for $\sum_{j=1}^{n} p_{j} x_{j}$ and $a$, we also have

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|\|a\| \geq\left\langle\sum_{j=1}^{n} p_{j} x_{j}, a\right\rangle_{i} . \tag{2.7}
\end{equation*}
$$

Therefore, by (2.5)-(2.7) we deduce the desired inequality (2.4).

Now assume that there exists a $D>0$ with the property that

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|\|a\|+\frac{1}{2} \sum_{j=1}^{n} p_{j}\left\|x_{j}-a\right\|^{2} \geq D\|a\|^{2} \tag{2.8}
\end{equation*}
$$

for any $n \geq 1, x_{j} \in X, p_{j} \geq 0, j \in\{1, \ldots, n\}$ with $\sum_{j=1}^{n} p_{j}=1$ and $a \in$ $X \backslash\{0\}$.

If in (2.8) we choose $n=1, p_{1}=1, x_{1}=\varepsilon a, \varepsilon \in(0,1)$, then we get

$$
\varepsilon\|a\|^{2}+\frac{1}{2}(1-\varepsilon)^{2}\|a\|^{2} \geq D\|a\|^{2}
$$

giving

$$
\varepsilon+\frac{1}{2}(1-\varepsilon)^{2} \geq D
$$

for any $\varepsilon \in(0,1)$. Letting $\varepsilon \rightarrow 0+$, we deduce $D \leq \frac{1}{2}$ and the proof is complete.

The following result may be stated as well:
Proposition 2.4. Let $x_{j}, a \in X$ with $a \neq 0$ and $\left\|x_{j}-a\right\| \leq\|a\|$ for each $j \in\{1, \ldots, n\}$. Then for any $p_{j} \geq 0, j \in\{1, \ldots, n\}$ with $\sum_{j=1}^{n} p_{j}=1$ we have

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|\|a\|+\frac{1}{2} \sum_{j=1}^{n} p_{j}\left\|x_{j}\right\|\left\|x_{j}-a\right\| \geq \frac{1}{2}\|a\| \sum_{j=1}^{n} p_{j}\left\|x_{j}\right\| \tag{2.9}
\end{equation*}
$$

Proof. From (2.3) we have

$$
\left\langle x_{j}, a\right\rangle_{i}+\frac{1}{2}\left\|x_{j}\right\|\left\|x_{j}-a\right\| \geq \frac{1}{2}\|a\|\left\|x_{j}\right\|
$$

for any $j \in\{1, \ldots, n\}$.
The proof follows in the same manner as in Theorem 2.3 and we omit the details.

The following reverse of the generalised triangle inequality may be stated:
Theorem 2.5. Let $x_{j} \in X \backslash\{0\}$ and $a \in X \backslash\{0\}$ such that $\|a\| \geq\left\|x_{j}-a\right\|$ for each $j \in\{1, \ldots, n\}$. Then for any $p_{j} \geq 0, j \in\{1, \ldots, n\}$ with $\sum_{j=1}^{n} p_{j}=1$ we have

$$
\begin{equation*}
\frac{\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|}{\sum_{j=1}^{n} p_{j}\left\|x_{j}\right\|} \geq \frac{1}{2} \min _{1 \leq j \leq n}\left\{\frac{\|a\|^{2}-\left\|a-x_{j}\right\|^{2}}{\left\|x_{j}\right\|\|a\|}\right\}(\geq 0) \tag{2.10}
\end{equation*}
$$

The constant $\frac{1}{2}$ is best possible in (2.10).

Proof. Let us denote

$$
\rho:=\min _{1 \leq j \leq n}\left\{\frac{\|a\|^{2}-\left\|a-x_{j}\right\|^{2}}{\left\|x_{j}\right\|}\right\} .
$$

From Lemma 2.1 we have

$$
\frac{\left\langle x_{j}, a\right\rangle_{i}}{\left\|x_{j}\right\|} \geq \frac{1}{2} \cdot \frac{\|a\|^{2}-\left\|x_{j}-a\right\|^{2}}{\left\|x_{j}\right\|} \geq \frac{1}{2} \rho
$$

for each $j \in\{1, \ldots, n\}$. Therefore

$$
\left\langle x_{j}, a\right\rangle_{i} \geq \frac{1}{2} \rho\left\|x_{j}\right\|, \quad j \in\{1, \ldots, n\}
$$

Multiplying with $p_{j}$ and summing over $j$ from 1 to $n$ we obtain

$$
\begin{equation*}
\sum_{j=1}^{n} p_{j}\left\langle x_{j}, a\right\rangle_{i} \geq \frac{1}{2} \rho \sum_{j=1}^{n} p_{j}\left\|x_{j}\right\| \tag{2.11}
\end{equation*}
$$

and since:

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|\|a\| \geq\left\langle\sum_{j=1}^{n} p_{j} x_{j}, a\right\rangle_{i} \geq \sum_{j=1}^{n} p_{j}\left\langle x_{j}, a\right\rangle_{i} \tag{2.12}
\end{equation*}
$$

hence by (2.11) and (2.12) we deduce the desired result (2.10).
Now, assume that there exists a constant $E>0$ such that

$$
\begin{equation*}
\frac{\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|}{\sum_{j=1}^{n} p_{j}\left\|x_{j}\right\|} \geq E \cdot \min _{1 \leq j \leq n}\left\{\frac{\|a\|^{2}-\left\|a-x_{j}\right\|^{2}}{\left\|x_{j}\right\|\|a\|}\right\} \tag{2.13}
\end{equation*}
$$

provided $\|a\| \geq\left\|x_{j}-a\right\|, j \in\{1, \ldots, n\}$.
If we choose $x_{1}=\cdots=x_{n}=\varepsilon a, \varepsilon \in(0,1)$, and $p_{1}=\ldots=p_{n}=\frac{1}{n}$, then we get

$$
1 \geq E \cdot \frac{\|a\|^{2}-(1-\varepsilon)^{2}\|a\|^{2}}{\varepsilon\|a\|^{2}}
$$

giving

$$
1 \geq E(2-\varepsilon)
$$

for any $\varepsilon \in(0,1)$. Letting $\varepsilon \rightarrow 0+$, we deduce $E \leq \frac{1}{2}$ and the proof is complete.

The following result may be stated as well:

Proposition 2.6. Let $x_{j}, a \in X \backslash\{0\}, j \in\{1, \ldots, n\}$ such that $\left\|x_{j}-a\right\| \leq$ $\|a\|$. Then for any $p_{j} \geq 0, j \in\{1, \ldots, n\}$ with $\sum_{j=1}^{n} p_{j}=1$ we have

$$
\begin{equation*}
\frac{\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|}{\sum_{j=1}^{n} p_{j}\left\|x_{j}\right\|} \geq \frac{\left(\|a\|-\max _{1 \leq j \leq n}\left\|x_{j}-a\right\|\right)}{2\|a\|} \quad(\geq 0) . \tag{2.14}
\end{equation*}
$$

Proof. From (2.3) we have

$$
\begin{aligned}
\frac{\left\langle x_{j}, a\right\rangle_{i}}{\left\|x_{j}\right\|} & \geq \frac{1}{2}\left(\|a\|-\left\|x_{j}-a\right\|\right) \\
& \geq \frac{1}{2} \min _{1 \leq j \leq n}\left(\|a\|-\left\|x_{j}-a\right\|\right) \\
& =\frac{1}{2}\left(\|a\|-\max _{1 \leq j \leq n}\left\|x_{j}-a\right\|\right) .
\end{aligned}
$$

Now the proof follows the same steps as in that of Theorem 2.3 and the details are omitted.

Remark 2.7. If $\|a\|=1$ and $\left\|x_{j}-a\right\| \leq 1$, then (2.10) has a simpler form:

$$
\begin{equation*}
\frac{\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|}{\sum_{j=1}^{n} p_{j}\left\|x_{j}\right\|} \geq \frac{1}{2} \min _{1 \leq j \leq n}\left\{\frac{1-\left\|x_{j}-a\right\|^{2}}{\left\|x_{j}\right\|}\right\}(\geq 0) \tag{2.15}
\end{equation*}
$$

while (2.14) becomes

$$
\begin{equation*}
\frac{\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|}{\sum_{j=1}^{n} p_{j}\left\|x_{j}\right\|} \geq \frac{1}{2}\left(1-\max _{1 \leq j \leq n}\left\|x_{j}-a\right\|\right)(\geq 0) . \tag{2.16}
\end{equation*}
$$

A different approach for bounding the semi-inner product is incorporated in the following:

Lemma 2.8. Let $(X,\|\cdot\|)$ be a normed space. If $x, a \in X$, then

$$
\begin{equation*}
\langle x, a\rangle_{i} \geq\|a\|(\|a\|-\|x-a\|) . \tag{2.17}
\end{equation*}
$$

The inequality (2.17) is sharp.
Proof. If $a=0$, then obviously (2.17) holds with equality. For $a \neq 0$, consider

$$
\tau_{-}(x, a):=\lim _{s \rightarrow 0-} \frac{\|a+s x\|-\|a\|}{s} .
$$

Observe that

$$
\begin{align*}
\langle x, a\rangle_{i} & =\lim _{s \rightarrow 0-} \frac{\|a+s x\|^{2}-\|a\|^{2}}{2 s}  \tag{2.18}\\
& =\tau_{-}(x, a) \lim _{s \rightarrow 0-}\left[\frac{\|a+s x\|+\|a\|}{2}\right] \\
& =\tau_{-}(x, a)\|a\| .
\end{align*}
$$

On the other hand, since the function $R \ni s \longmapsto\|a+s x\| \in \mathbb{R}_{+}$is convex on $\mathbb{R}$, hence

$$
\begin{equation*}
\tau_{-}(x, a) \geq \frac{\|a+(-1) x\|-\|a\|}{(-1)}=\|a\|-\|x-a\| . \tag{2.19}
\end{equation*}
$$

Consequently, by (2.18) and (2.19) we get (2.17).
Now, let $x=\varepsilon a, \varepsilon \in(0,1), a \neq 0$. Then

$$
\langle x, a\rangle_{i}=\varepsilon\|a\|^{2}, \quad\|a\|-\|x-a\|=\|a\|-(1-\varepsilon)\|a\|=\varepsilon\|a\|,
$$

which shows that the equality case in (2.17) holds true for the nonzero quantities $\varepsilon\|a\|^{2}$. The proof is complete.

The following reverse of the generalised triangle inequality may be stated.
Theorem 2.9. Let $a, x_{j} \in X \backslash\{0\}$ for $j \in\{1, \ldots, n\}$ with the property that $\|a\| \geq\left\|x_{j}-a\right\|$ for $j \in\{1, \ldots, n\}$. Then for any $p_{j} \geq 0, j \in\{1, \ldots, n\}$ with $\sum_{j=1}^{n} p_{j}=1$ we have

$$
\begin{equation*}
\frac{\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|}{\sum_{j=1}^{n} p_{j}\left\|x_{j}\right\|} \geq \min _{1 \leq j \leq n}\left\{\frac{\|a\|-\left\|x_{j}-a\right\|}{\left\|x_{j}\right\|}\right\} \quad(\geq 0) \tag{2.20}
\end{equation*}
$$

The inequality (2.20) is sharp.
Proof. On making use of Lemma 2.8, we have:

$$
\begin{aligned}
\frac{\left\langle x_{j}, a\right\rangle_{i}}{\left\|x_{j}\right\|} & \geq\|a\|\left(\frac{\|a\|-\left\|x_{j}-a\right\|}{\left\|x_{j}\right\|}\right) \\
& \geq\|a\| \eta,
\end{aligned}
$$

for each $j \in\{1, \ldots, n\}$, where

$$
\eta:=\min _{1 \leq j \leq n}\left\{\frac{\|a\|-\left\|x_{j}-a\right\|}{\left\|x_{j}\right\|}\right\} .
$$

Now utilising the same argument explained in the proof of Theorem 2.5, we get the desired inequality (2.20).

If we choose in (2.20) $x_{1}=\cdots=x_{n}=\varepsilon a, \varepsilon \in(0,1), a \neq 0$, and $p_{1}=\ldots=$ $p_{n}=1$ then we have equality, and the proof is complete.

Remark 2.10. The above result may be stated in a simpler way, i.e., if $\rho \in(0,1), a$ and $x_{j} \in X \backslash\{0\}, j \in\{1, \ldots, n\}$ are such that

$$
\begin{equation*}
\left(\left\|x_{j}\right\| \geq\right)\|a\|-\left\|x_{j}-a\right\| \geq \rho\left\|x_{j}\right\| \quad(\geq 0) \tag{2.21}
\end{equation*}
$$

for each $j \in\{1, \ldots, n\}$, then

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\| \geq \rho \sum_{j=1}^{n} p_{j}\left\|x_{j}\right\| \tag{2.22}
\end{equation*}
$$

## 3. Other Related Results to the triangle inequality

The following result may be stated:
Theorem 3.1. Let $(X,\|\cdot\|)$ be a normed linear space and $x_{1}, \ldots, x_{n}$ nonzero vectors in $X$ and $p_{j} \geq 0$ with $\sum_{j=1}^{n} p_{j}=1$. If $\bar{x}_{p}:=\sum_{j=1}^{n} p_{j} x_{j} \neq 0$ and there exists a number $r>0$ with

$$
\begin{equation*}
\frac{\left\langle x_{j}, \bar{x}_{p}\right\rangle_{i}}{\left\|x_{j}\right\|\left\|\bar{x}_{p}\right\|} \geq r \quad \text { for each } \quad j \in\{1, \ldots, n\} \tag{3.1}
\end{equation*}
$$

then

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\| \geq r \sum_{j=1}^{n} p_{j}\left\|x_{j}\right\| . \tag{3.2}
\end{equation*}
$$

If $p_{j}>0$ for each $j \in\{1, \ldots, n\}$, then the equality holds in (3.2) if and only if the equality case hold in (3.1) for each $j \in\{1, \ldots, n\}$.
Proof. From (3.1) on multiplying with $p_{i} \geq 0$ we have

$$
\left\langle p_{j} x_{j}, \bar{x}_{p}\right\rangle_{i} \geq r p_{j}\left\|\bar{x}_{p}\right\|\left\|x_{j}\right\|
$$

for any $j \in\{1, \ldots, n\}$.
Summing over $j$ from 1 to $n$ and taking into account the superadditivity property of the interior semi-inner product, we have

$$
\begin{equation*}
\left\langle\sum_{j=1}^{n} p_{j} x_{j}, \bar{x}_{p}\right\rangle_{i} \geq \sum_{j=1}^{n}\left\langle p_{j} x_{j}, \bar{x}_{p}\right\rangle_{i} \geq r\left\|\bar{x}_{p}\right\| \sum_{j=1}^{n} p_{j}\left\|x_{j}\right\| \tag{3.3}
\end{equation*}
$$

and since

$$
\left\langle\sum_{j=1}^{n} p_{j} x_{j}, \bar{x}_{p}\right\rangle_{i}=\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\|^{2} \neq 0
$$

hence by (3.3) we get (3.2).
The equality case is obvious and the proof is complete.

For the system of vectors $x_{1}, \ldots, x_{k} \in X$, we denote by $\bar{x}$ its gravity center, i.e.,

$$
\bar{x}:=\frac{1}{n} \sum_{i=1}^{n} x_{i} .
$$

The following corollary is obvious.
Corollary 3.2. Let $x_{1}, \ldots, x_{n} \in X \backslash\{0\}$ be such that $\bar{x} \neq 0$. If there exists $a$ number $r>0$ such that

$$
\begin{equation*}
\frac{\left\langle x_{j}, \bar{x}\right\rangle_{i}}{\left\|x_{j}\right\|\|\bar{x}\|} \geq r \quad \text { for each } \quad j \in\{1, \ldots, n\} \tag{3.4}
\end{equation*}
$$

then the following reverse of the generalised triangle inequality holds:

$$
\begin{equation*}
\left\|\sum_{j=1}^{n} x_{j}\right\| \geq r \sum_{j=1}^{n}\left\|x_{j}\right\| \tag{3.5}
\end{equation*}
$$

The equality holds in (3.5) if and only if the case of equality holds in (3.4) for each $j \in\{1, \ldots, n\}$.

The following refinements of the generalised triangle inequality may be stated as well:

Theorem 3.3. Let $x_{i}, \bar{x}_{p}, p_{i}, i \in\{1, \ldots, n\}$ be as in Theorem 3.1. If there exists a number $R$ with $1>R>0$ and such that

$$
\begin{equation*}
R \geq \frac{\left\langle x_{j}, \bar{x}_{p}\right\rangle_{s}}{\left\|x_{j}\right\|\left\|\bar{x}_{p}\right\|} \quad \text { for each } j \in\{1, \ldots, n\} \tag{3.6}
\end{equation*}
$$

then

$$
\begin{equation*}
R \sum_{j=1}^{n} p_{j}\left\|x_{j}\right\| \geq\left\|\sum_{j=1}^{n} p_{j} x_{j}\right\| \tag{3.7}
\end{equation*}
$$

If $p_{j}>0$ for each $j \in\{1, \ldots, n\}$, then the equality holds in (3.7) if and only if the equality case holds in (3.6) for each $j \in\{1, \ldots, n\}$.

The proof is similar to the one in Theorem 3.1 on taking into account that the superior semi-inner product is a subadditative functional in the first variable.

Corollary 3.4. Let $x_{j}, j \in\{1, \ldots, n\}$ be as in Corollary 3.2. If there exists an $R$ with $1>R>0$ and

$$
\begin{equation*}
R \geq \frac{\left\langle x_{j}, \bar{x}\right\rangle_{s}}{\left\|x_{j}\right\|\|\bar{x}\|} \quad \text { for each } \quad j \in\{1, \ldots, n\} \tag{3.8}
\end{equation*}
$$

then the following refinement of the generalised triangle inequality holds:

$$
\begin{equation*}
R \sum_{j=1}^{n}\left\|x_{j}\right\| \geq\left\|\sum_{j=1}^{n} x_{j}\right\| \tag{3.9}
\end{equation*}
$$

The equality hold in (3.9) if and only if the case of equality holds in (3.8) for each $j \in\{1, \ldots, n\}$.
